

THATO KGOLE

zembeccloudcomputing@gmail.com | 066 231 1146 | linkedin.com/in/zembe-cloud | github.com/TKgole-Cloud

PROFESSIONAL SUMMARY

Motivated, self-driven junior cloud professional, Microsoft Certified: Azure Fundamentals (AZ-900), with hands-on experience independently designing, building, breaking, investigating, and documenting real Azure environments. Practical exposure to Infrastructure as Code (Terraform), containers and Kubernetes (Docker, AKS), CI/CD (GitHub Actions), and cloud security fundamentals (Zero Trust, RBAC, Least Privilege, Conditional Access). Seeking a junior, graduate, internship, or learnership opportunity in Cloud Engineering, DevOps, or Cloud Security to apply and grow this foundation in a professional environment.

CERTIFICATIONS

- Microsoft Certified: Azure Fundamentals (AZ-900) — September 2026

TECHNICAL SKILLS

Cloud Platform (Microsoft Azure): Resource Groups, Virtual Networks & Subnets, Network Security Groups, App Service, Azure Kubernetes Service (AKS), Azure Container Registry, Key Vault, Storage Accounts, Microsoft Entra ID, Log Analytics, Microsoft Sentinel, Microsoft Defender for Cloud

Infrastructure as Code: Terraform (providers, resources, variables, outputs, plan/apply workflow)

Containers & Orchestration: Docker (Dockerfiles, image builds, containers), Kubernetes fundamentals (Pods, Deployments, Services), Azure Kubernetes Service (AKS)

CI/CD & Automation: GitHub Actions, OIDC-based passwordless authentication

Identity & Security: Zero Trust principles, Role-Based Access Control (RBAC), Least Privilege, Conditional Access, Privileged Identity Management (PIM), Managed Identity

Monitoring & Investigation: Log Analytics, Kusto Query Language (KQL), Microsoft Sentinel

Version Control: Git, GitHub

Operating Systems & Networking: Linux command line (permissions, SSH, process management), IP addressing & subnetting, firewalls/NSGs, routing, NAT

PROJECTS

AzureTech — Enterprise IAM & Least-Privilege Lab | *GitHub: AzureTech-IAM-Lab*

Stack: Microsoft Entra ID, Entra ID Groups, Azure RBAC, Conditional Access, Privileged Identity Management (PIM), Access Testing

- Designed and built an enterprise-style Azure IAM environment for a fictional company, structuring access through Entra ID security groups (Developers, Security, Cloud Admins) rather than direct user-to-role assignments.
- Simulated an excessive-permission scenario (a Developers group granted Contributor access at subscription scope), tested and confirmed the inherited effective access, then investigated root cause and remediated by rescoping the assignment to the resource-group level.
- Configured Privileged Identity Management (PIM) to convert a standing Cloud Admin Contributor assignment into a time-limited, MFA-gated, Eligible role activation, removing permanent privileged access.
- Implemented and validated a Conditional Access policy requiring MFA for the Developers group, confirming enforcement through Microsoft Entra sign-in logs.
- Documented the full design-build-test-break-investigate-fix-validate methodology with before/after evidence for each control.

AKS Static Web App — Containerized CI/CD Pipeline | *GitHub: AKS-Static-Web-App*

Stack: Docker, Azure Container Registry, Azure Kubernetes Service, Terraform, GitHub Actions, OIDC

- Built an end-to-end DevOps pipeline: containerized a web application with Docker, provisioned Azure infrastructure with Terraform, and deployed it to Azure Kubernetes Service running 3 replicated pods behind a LoadBalancer.

- Automated container builds and Kubernetes rolling deployments using GitHub Actions, tagging each image with the Git commit SHA for full deployment traceability.
- Configured passwordless GitHub-to-Azure authentication using OpenID Connect (OIDC), removing the need for long-lived Azure credentials in the CI/CD pipeline.
- Granted the AKS cluster least-privilege AcrPull access to a private Azure Container Registry, avoiding stored registry credentials.

Azure Secure Landing Zone | *GitHub: -azure-secure-landing-zone*

Stack: Terraform, Azure Virtual Network, NSGs, Managed Identity, Log Analytics, Microsoft Defender for Cloud

- Designed and deployed a segmented Azure network (isolated web and data subnets, each with a dedicated NSG) with least-privilege Managed Identity access, using Terraform.
- Deployed centralized monitoring with a Log Analytics Workspace, NSG flow logs, and Microsoft Defender for Cloud.
- Simulated, investigated, and remediated a real network misconfiguration that exposed a private subnet to the internet, validating the fix through independent external connectivity testing.
- Resolved a live Azure Policy compliance failure encountered during deployment by identifying and applying required resource tagging.

ADDITIONAL INFORMATION

- Open to relocation and remote work.
- Available for junior, graduate, internship, learnership, and volunteer opportunities.
- Full portfolio and project documentation available on GitHub: github.com/TKgole-Cloud
